P2P with TomP2P

Introduction

TomP2P

TomP2P is an extended DHT

- ▶ Distributed hash table concept → put (key, value) / get (key)
- ▶ Extended DHT operations →
- put(key1,key2,value) / add(key, value)

TomP2P features (v.4.1)

- Java6 DHT implementation with non-blocking IO
- Replication (direct / indirect)
- Mesh-based distributed tracker
- Stores multiple values for one key (examples follow)
- Storage is memory-based or disk-based

Università Zürich**

P2P with TomP2P

Introduction

TomP2P

TomP2P history

- ▶ TomP2P v1: Created in 2004 and used for a distributed DNS project
 - ▶ This version used blocking IO operations (1 thread / socket)
- ► TomP2P v2: Apache MINA (java.nio framework) / 6K LoC
 - Not well designed for non-blocking operations (event-driven)
- ▶ TomP2P v3: Redesigned for non-blocking operations
- Switched to Netty / 14K LoC, 6K LoC JUnits ► TomP2P v4: API refinements, new features
 - Current release (preview) 4.1
 - Latest feature (work in progress) MapReduce
 - ▶ 22K LoC, 8K LoC JUnits

Introduction

TomP2P

- Academic background (CSG UZH):
 - ▶ Used in EU projects: EC-GIN, EMANICS, SmoothIT
 - ▶ Used in research projects: FastSS, LiveShift, PSH, B-Tracker, DRFS
- http://tomp2p.net
 - ► For questions: mailinglist (http://lists.tomp2p.net/cgi-bin/mailman/listinfo)
 - ▶ Specific questions: bocek -at- ifi.uzh.ch or tom -at- tomp2p.net
 - ► Documentation: http://tomp2p.net/doc/ (TomP2P v4.0) Overview: http://en.wikipedia.org/wiki/TomP2P
 - If something is missing, ask!
 - ▶ Development: https://github.com/tomp2p
 - Feature request possible if good reasons provided
- Demo: how to setup TomP2P with Eclipse/git/maven

P2P with TomP2P

 Demo: a simple put / get example Package net.tomp2p.examples.Examples

Example

P2P with TomP2P

vs.

Number160 nr = new Number160(rnd);
FutureDHT dutureDHT = peers[30].put(nr, new Data("hallo"));
futureDHT.awaltuminterruptibly();
System.out.println("peer 30 stored [key: "+nr+", value: \"hallo\"]");
futureDHT.awaltuminterruptibly();
System.out.println("peer 77 got: \" + futureDHT.getData().getDbject() + "\" for the key "+nr);
// the output should look like this:
// peer 30 stored [key: 0x8992x6093029824e810fd7416d729ef2eb9ad3cfc, value: "hallo"]
// peer 77 got: "hallo" for the key 0x8992x6093029824e810fd7416d729ef2eb9ad3cfc

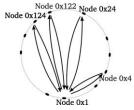

public static void examplePutGet(Peer[] peers) throws IOException, ClassNotFoundException

Recursive routing

Fundamental Concepts

Node 0x122 Node 0x24 Node 0x124 de 0x4

Node 0x1

iterative routing

- + online status update
- faulty peers cause delay
- + control - neighbor maintenance

Università

P2P with TomP2P

10

3. Fundamental Concepts

XOR-based iterative routing **Futures API** Overview

P2P with TomP2P

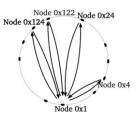

Fundamental Concepts

TomP2P: iterative XOR-based routing

- ▶ Node and data item unique 160bit identifier
- ▶ Keys are located on the nodes whose node ID is closest to the key
- Search for a key:
 - Lookup in neighbor table for Lookup in neighbor table ror closest peer (e.g. peers with ID: 0x1, Node 0x124

My ID	Neighbor ID	Distance (XOR)
1	2	3
1	3	2
1	4	5

Difference to Pastry: one metric, no leaf set / routing table

Fundamental Concepts

TomP2P iterative XOR-based routing

- ▶ Neighbors stored in 159 "bags", bag has capacity c (Kademlia, c=20)
- Routing takes O(log n) → M03, slides 12
- ▶ By default UDP, message header 56 bytes
- Configuration options (RoutingConfiguration.java)
 - ▶ directHits used for get() operations. (routing sends digest)
 - ▶ forceTCP use TCP instead of UDP
 - maxSuccess, maxFailure stop conditions
 - ▶ parallel number of parallel connections
 - maxNoNewInfoDiff stop condition. Stops if no new information was reported. Difference to minimumResults (e.g. for ${\tt get}\;({\tt key})$)
- ▶ For the CT don't worry, default settings are fine ©

P2P with TomP2P

Universität

11

CSG

P2P with TomP2P

12

Fundamental Concepts

- All distributed operations use futures
- Future objects
 - ▶ Keeps track of future events, while the "normal" program flow $continues \rightarrow addListener() or await()$
 - await(): Operations are executed in same thread
 - ▶ addListener(): Operations are executed in same or other thread
- · Demo: blocking operation (net.tomp2p.examples.Examples)

```
public static void exampleGetBlocking(Peer[] nodes, Number160 nr)
   FutureDHT futureDHT = nodes[77].get(nr);
  //blocking operation
futureDHT.awaitUninterruptibly();
System.out.println("result: "*futureDHT.getObject());
System.out.println("this may *not* happen before printing the result");
```

P2P with TomP2P

13

Fundamental Concepts

- Demo: non blocking operation (net.tomp2p.examples.Examples)
 - ▶ New utilities necessary (loops as recursions)
 - ▶ Advise: use addListener (...) as much as possible!
 - ▶ operationComplete(...) must be always called

```
public static void exampleGetNonBlocking(Peer[] nodes, Number160 nr)
  FutureDHT futureDHT = nodes[77].get(nr);
  //non-blocking operation
futureDHT.addListener(new BaseFutureAdapter<FutureDHT>() {
     GOVERTIDE
public void operationComplete(FutureDHT future) throws Exception {
   System.out.println("result: "+future.getObject());
  System.out.println("this may happen before printing the result");
```

P2P with TomP2P

14

16

Fundamental Concepts

- Future utilities
 - ▶ FutureForkJoin(int nr, boolean cancel, K... Forks)
 - Joins already "forked" futures. Waits until all or nr future finished. If nr reached, futures may be cancelled (e.g. abort download)
 - ▶ FutureLateJoin(int nrMaxFutures, int minSuccess) FutureLaterJoin()
 - No need to add the futures in the constructor, can be added later
 - ► FutureWrapper()
 - A placeholder for futures that are created later
- ForkJoin in Java7
 - ► Fork and join framework future utilities in TomP2P focus on join, forking is done "manually"

P2P with TomP2P

15

Fundamental Concepts

Fun with futures: loops

```
p() {
  Future future = new Future();
  recLoop(future);
  return future;
s

id operationComplete(FutureForkToin<FutureResponse> futu
comption {
    boolean finished = evaluate(future);
    if(finished) future.weAreBone();
    else resLoop(future);
```

P2P with TomP2P

Fundamental Concepts

API Overview: Peer.java

put(key, value),get(key)

digest(key)/remove(key)

■ For initial connection: boostrapBroadcast() /

Used mostly internally parallelRequests (...)

► Additional methods in TomP2P:

Basic methods for DHTs

Universit Zürich**

Fundamental Concepts

CSG

- Configurations used in the API
 - ▶ TomP2P can store multiple values for a key
 - put(location_key, content_key, value) → content_key specified in Configurations
 - get(location kev)
 - → returns a map with [content_key, value]
 - lacksquare add(location_key, value) ightarrow is translated to put(location_key, hash(value), value)
 - ► TomP2P support domains
 - Avoid collision for same kevs
 - Domains are used for protection (more details later)
 - Domains specified in Configurations
 - put(key, domain, value) → get(key, domain)

port)

P2P with TomP2P

boostrap(Ipaddress, port)/discover(IPaddress, port,

value) / send (peerconnection, value) / send (key, value)

Tracker operations: getFromTracker(key) /addToTracker(key,

Data manipulation: add(key, value)/putIfAbsent(key, value)/

Requires to specify set*DataReply(...):send(peeraddress,

17

P2P with TomP2P

18

Fundamental Concepts

Configurations Example

```
Number160 nr = new Number160(rnd);
ConfigurationStore cs = Configurations.defaultStoreConfiguration();
cs.setDonain(Number160 createHash("my_domain"));
cs.setContentKey(new Number160(11));
FutureDHT futureDHT = peers[30].put(nr, new Data("hallo"), cs);

public static ConfigurationStore defaultStoreConfiguration()
{
    ConfigurationStore config = new ConfigurationStore();
    config.setRequestP2PConfiguration(new RequestP2PConfiguration(3, 5, 3));
    config.setBomain(DEFAULT DOMAIN);
    config.setContentKey(Number160.2ERD);
    config.setStoreIfAbsent(false);
    config.setStoreIfAbsent(false);
    config.setStoreIfAbsent(false);
    config.setStoreIfAbsent(false);
    config.setStoreStoreMash();
    config.setStoreStoreMash();
    config.setStoreStoreMash();
    config.setStoreStoreMash();
    config.setStoreStoreMash();
    config.setAutomaticCleanup(true);
    return config;
}
```

5. Components with Examples

DHT Tracker

P2P with TomP2P

19

Universität Zürich***

P2P with TomP2P

20

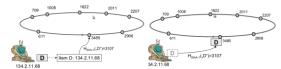

Components with Examples

DHT vs. Tracker

- ▶ M03, slide 23: DHT "stored by value" direct storage
- ▶ M03, slide 24: Tracker "stored by reference" indirect storage

indirect (Tracker)

direct (DHT)

P2P with TomP2P

21

Components with Examples

B-Tracker

- ► Centralized tracker one peer gets traffic
- ▶ DHT: store reference on 20 peers 20 peers gets traffic
- ▶ PEX: exchange information every minute (push)
- \blacktriangleright B-Tracker, every downloading peer becomes a tracker \rightarrow forms mesh
 - Better balance of load
 - To avoid duplicates send compressed list of known peers
- ▶ B-Tracker in TomP2P enabled by default
- ▶ Currently tests with B-Tracker in Vuze

Universitä Zürich***

P2P with TomP2P

22

Components with Examples

- Demo: Tracker with exchange of popular items (net.tomp2p.examples.ExampleTracker)
 - ▶ Creat 100 peers, 3 peers have initially each a song
 - ▶ M03 slide 26: peer joining / bootstrap

Universität Zürich***

P2P with TomP2P

Components with Examples

- Demo: Tracker with exchange of popular items
 - ▶ Although demo uses await (), try not to use it
- Demo: Store popular items in DHT (net.tomp2p.examples.ExampleDHT)
 - ► Tracker vs. DHT what is better for the CT? You decide!
- Further interesting aspects for the challenge task:
 - ► Automate downloads
 - ➤ Suggestions evaluated by the user
 - ▶ How to do this more anonymous: music list from a peer is known
 - ► Incentives
 - ▶ Spamming the system with bogus suggestions

23

P2P with TomP2P

24

6. Advanced Topics

NAT (UPNP/NAT-PMP) Security Replication SimGrid integration Direct data connection / persistent connection Android

Universität Zürich*** CSG P2P with TomP2P

25

Advanced Topics

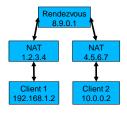

NAT

- ▶ Network Address Translation breaks end-to-end
- ▶ "If nothing else, [NAT] can serve to provide temporarily relief while other, more complex and far-reaching solutions are worked out" (RFC 1631 - The IP Network Address Translator (NAT))
- ► Easy solutions: UPNP / NAT-PMP
 - Both configure port forwarding, but UPNP is more
 - UPNP: discover devices uses broadcasting to find router (Simple Service Discovery Protocol)
 - UPNP: configure devices uses HTTP and XML to configure portforwarding (Internet Gateway Device Protocol)
 - NAT-PMP: protocol made for configuring port-forwarding, but no discover

Universität Zürich** P2P with TomP2P CSG 26

Advanced Topics

- NAT: Difficult solution: rendezvous / relay peer which does "hole punching", in worst case relay traffic.
- Hole punching
 - ▶ Client 1 wants to connect to Client 2 (both clients maintain connection to Rendezvous)
 - ▶ Client 1 sends connection request to $\text{Rendezvous} \rightarrow \text{Redezvous send}$ connection request to Client 2 and the outgoing port X that Client 1 will use and send to Client 1 what outigoing port Y will be used by Client 2 (guess!)

Universität

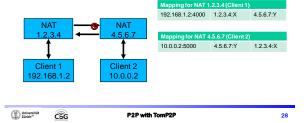

P2P with TomP2P

27

Advanced Topics

- Hole punching
 - ▶ Client 1 sends request to NAT 4.5.6.7 that will fail no mapping, however, Client 1 creates a mapping with that request
 - ► Client 2 send a request to Client 1 (1.2.3.4:X) success!

Advanced Topics

- NAT example in TomP2P, the easy solution
 - ▶ TomP2P supports NAT-PMP and UPNP, no holepunching or relaying
 - ▶ Before bootstrap: peer.discover (PeerAddress);
 - ▶ How it works: (1) send request how others peers sees our IP
 - If other peers sees the same IP as we see, we are fine
 - If not, we are most likely behind a NAT
 - (2) do UPNP, if it fails, do NAT-PMP, if it fails, no connection
 - ▶ (3) If it works test connection, send request to other peer to contact us using the port we just set up.
 - ▶ (4) If we get contacted by this peer within 5 sec, port-forwarding
 - ▶ Manual setup possible using Bindings.java
- No Demo, did not bring my NAT device

P2P with TomP2P

Advanced Topics

- Security in TomP2P
 - ▶ Signature-based, no data encryption
 - ▶ Messages are signed using SHA1 with DSA
 - ▶ Sybil attacks!
 - This attack creates large number of identities, may collude
- How to prevent Data from being overwritten Domain and entry protection, requires cooperation

 - ▶ StorageGeneric.setProtection(...)

	For domains and entries			
ı	protectionEnabled	ALL	NONE	
I	protectionMode	NO_MASTER	MASTER_PUBLIC_KEY	

Advanced Topics

Domain protection

- ► Set publick key new PeerMaker (PublicKey)
 - Enable=ALL, Mode=NO_MASTER → every peer can protect domains, first come first served
 - Enable=NONE, Mode=NO_MASTER → no peer can protect domains
 - Enable=ALL, Mode=MASTER_PUBLIC_KEY → every peer can protect domains, the owner can claim domain
 - Enable=NONE, Mode=MASTER_PUBLIC_KEY

 no peer can protect domains except the owner
- Owner of domain 0x1234 is peer where 0x1234 == hash(public_key)
- ► Same concept for entries
- Tracker should have no domain protection and entry protection set to Enable=NONE, Mode=MASTER PUBLIC KEY → WiP

Demo

Universität

P2P with TomP2P

31

Advanced Topics

▶ Demo 1 (net.tomp2p.examples.ExampleSecurity):

- 3 peers, all with public keys
- ▶ Setup for domains: Enable=ALL, Mode=MASTER_PUBLIC_KEY
- (1) peer1 stores data in domain2 → success
- ▶ (2) peer3 wants to store data in domain2 → fail
- (3) peer2 wants to store data in domain2 → success

▶ Demo 2 (net.tomp2p.examples.ExampleSecurity):

- ▶ 3 peers, all with public keys
- ▶ Setup for domains: Enable=NONE, Mode=MASTER_PUBLIC_KEY
- (1) peer1 stores data in domain2 → success
- (2) peer3 wants to store data in domain2 → success
- (3) peer2 wants to store data in domain2 → success
- (4) peer3 wants to store data in domain2 → fail

P2P with TomP2P

32

Advanced Topics

Replication

- Enough replicas
- Direct replication

 - Originator peer is responsible Periodically refresh replicas
 - Example: tracker that announces its data

Problem

▶ Originator offline → replicas disappear. Content has TTL, e.g.

data.setTTLSeconds(15)

Responsible for X

Originator of X

Close peers to X

University

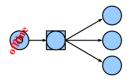

33

Advanced Topics

Indirect Replication

- ▶ The closest peer is responsible, originator may go offline
 - Periodically checks if enough replicas exist
 - Detects if responsibility changes

Problem

 Requires cooperation between responsible peer and originator

Responsible for X

Close peers to X

Originator of X

▶ Multiple peers may think they are responsible for different versions \rightarrow eventually solved

P2P with TomP2P

University 70 of the

P2P with TomP2P

Advanced Topics

Replication Demo (net.tomp2p.examples.ExampleDirectReplication)

- ▶ Direct replication for put () and add ()
 - ConfigurationStore.setRefreshSeconds (2);
 - Stop replication if in progress: futureDHT.shutdown();
- ▶ Direct replication for remove ()
 - ConfigurationRemove.setRefreshSeconds(2);
 - ConfigurationRemove.setRepetitions(2);
 - Stop replication after 4 seconds, 2 repetitions
- ▶ Indirect replication (net.tomp2p.examples.ExampleIndirectReplication)
 - Set when creating peers
 - PeerMaker.setEnableIndirectReplication(true);
 - Two types of events: (1) peer learns about closer peer (2) peer checks frequently for enough replicas

P2P with TomP2P

Advanced Topics

SimGrid integration

- ▶ Scalable simulation of distributed systems
- ▶ Publish over 100 papers that include SimGrid
- ► SimGrid vs. real network
- ▶ For TomP2P: simulates network with many peers
 - Defined in XML files: platform.xml and deployment.xml
- Logging in console
- Current issue in jMSG: threads, threads, threads!
- Demo: how to use it with TomP2P
 - ► Get the Eclipse workspace: http://tomp2p.net/dev/simgrid/ (Linux x64)
 - ▶ 10'000 peers are OK, to simulate more, kernel parameter tuning

Advanced Topics

- Direct data and persistent connections
 - ▶ All connections in TomP2P are RPC and very short-lived
 - Open connection request reply close connection
 - ▶ Direct data as seen in the tracker example → keep alive
 - \blacktriangleright Direct send (PeerAddress, ...) or with routing send (key, ...) ;
 - ▶ Always use setObjectDataReply() or setRawDataReply()
 - Object serializes object to byte[] (easy)
 - Raw exposes (Netty) buffer to the user for your own protocol (more work)
 - ▶ Persistent connections set by the user
 - Only for direct send send (PeerAddress, ...)
- Demo with persistent connections (net.tomp2p.examples.ExamplePersistentConnection)

P2P with TomP2P

Advanced Topics

- TomP2P with Android (early research)
 - ► CSG: early adopter

Universität Zürich**

P2P with TomP2P

Advanced Topics

- TomP2P with Android ICS 4.0.3
 - ▶ Latest Android is ~Java6 (source code) compatible
 - Extra work (permissions, IPv4)
 - ► TomP2P with multiple emulators
 - Redirect ports!
 - telnet to all emulators: redir add udp:x:y
 - redir add tcp:x:y Connect to 10.0.2.2!
- TomP2P on Android: Demo with local peers

P2P with TomP2P
